Name (Print/Type)	M. Daniel Hefner		
Signature		Date	September 11, 2003

In re Appln. of Kasid et al.
Application No. 09/930,283

Amendments to the Abstract:

Please replace the paragraph appearing on page 31 of the application under the section heading "Abstract" with the following (note the underlining of "c-raf-1" in the second line is formatting from the original; it does not signify an amendment):

It is possible to radiosensitize tumor cells by administration of compositions containing the Human antisense c-raf-1 oligodeoxyribonucleotide (ODN/oligo) sequence: 5'-GTGCTCCATTGATGC-3' (see #1) (SEQ ID NO: 1) wherein only the end bases are phosphorylated in a preferred embodiment. Antisense sequences of up to 40 bases which containing this sequence may be used in accord with the teachings of this disclosure. Compositions comprising a cationic liposome of dimethyldioctadecyl ammonium bromide, phosphatidylcholine and cholesterol may be used as a carrier system. The liposomes provide a new carrier system that is particularly useful for administration of sequences for therapy.
